DES, or discrete-event simulation, is the simulation of a system that can be modeled by events that happen at given times. It is used in manufacturing, supply chain, healthcare, etc. to improve the way a system flows. DES is useful because it allows users to test changes to a system without the risk involved in changing the actual system.

A discrete-event simulation models the operation of a system as a sequence of events in time. Each event occurs at a particular instant in time and marks a change of state in the system. Between consecutive events, no change in the system is assumed to occur; thus the simulation time can directly jump to the occurrence time of the next event, which is called next-event time progression. In addition to next-event time progression, there is also an alternative approach, called fixed-increment time
